Efficient and multi-talented

Combination microwave ovens from Miele save time and excel through versatility.

The new Miele microwave combination ovens are particularly versatile and extremely energy-efficient. Their repertoire ranges from the fast reheating of food, to the most demanding baking and roasting operations. Thanks to their compact dimensions, they fit the bill perfectly in smaller kitchens or ideally complement a conventional oven.

Whether you want to warm a cup of cocoa or bake a delicious cake – you only have to set the microwave output and the oven operating mode on the Miele oven with microwave. These machines come into their own, though, when both functions are combined – for example when you roast meat – in these circumstances, cooking times are reduced by around one third. A further practical feature is the popcorn programme, which makes fresh popcorn at the touch of a single button.

Despite their compact size, Miele's microwave combination ovens still boast a large 43-litre stainless-steel cabinet. Compared to enamelled cabinets, stainless steel offers a decisive benefit in that it helps to reduce energy consumption due to its enhanced energy efficiency. They are also really simple to clean, as the linen-weave stainless-steel surface features Miele's PerfectClean finish, which offer excellent non-stick properties and can be simply wiped clean.

All models sport a compact form that allows them to be installed in a 45cm kitchen recess. In combination with a 14cm warmer drawer, the two appliances neatly slot into a classic 60 cm cabinetry recess. The look and design of these appliances harmonise perfectly with the rest of Miele's Generation 6000 range of built-in appliances with respect to form and function – appearing to come from the same mould. As a result, vertical or horizontal multi installations can be grouped together for a streamlined integrated aesthetic.

Alongside a choice of colours, which include CleanSteel, Obsidian Black, Brilliant White and Havanna Brown, customers can also select between EasyControl, DirectControl (both with rotary selectors), and the high-end M Touch interface. M Touch stands for a TFT display where settings are made by swiping or scrolling on the glass display similar to that on a modern smartphone.
